

Functional Requirements

1. Authentication

- The system should allow users to sign up and sign in.
- The system should support secure authentication and session management.
- The system should provide a forgot password option.

2. User Profile

- The system should allow users to view their profile.
- The system should store personal information, GitHub data, and portfolio settings.
- The system should allow users to add social links such as LinkedIn and portfolio URLs.

3. User Dashboard

- The system should display user portfolios and saved data.
- The system should allow editing, deleting, and managing portfolios.
- The system should show portfolio completion progress.
- The system should display recent generated content and activity.

4. Admin Dashboard

- The system should allow admin to manage users and portfolios.
- The system should display system activity and analytics.
- The system should show total users, active users, and total portfolios generated.

5. User Input

- The system should allow users to enter personal information and GitHub link.
- The system should validate input data before submission.
- The system should store and manage user input data.

6. GitHub Integration

- The system should fetch GitHub profile data and repositories.
- The system should retrieve profile bio, programming languages, followers, stars, and repository details.
- The system should allow users to select, edit, and manage imported projects.

7. Portfolio Builder

- The system should provide a multi-step form including Personal Information, Skills, Projects, and About Me.
- The system should allow users to add, edit, and delete projects and skills.
- The system should allow users to save drafts.
- The system should allow navigation between steps without losing data.

8. AI Generation

- The system should generate About Me content.
- The system should generate skills summaries.
- The system should generate project descriptions.
- The system should generate SEO-friendly portfolio headlines and text.
- The system should allow users to edit and regenerate AI-generated content.

9. Live Preview

- The system should provide a real-time responsive preview of the portfolio.
- The system should automatically update the preview when content changes.
- The system should support desktop, tablet, and mobile preview modes.

10. Navigation

- The system should allow users to navigate between Builder, Preview, Export, Profile, and Dashboard.
- The system should preserve state while navigating.

11. Export

- The system should allow users to export their portfolio as HTML, Markdown, JSON, and PDF.
- The system should allow users to copy or download portfolio content.

12. Error Handling

- The system should display errors for invalid GitHub usernames, missing data, and API issues.
- The system should handle empty states and failed requests.
- The system should show loading states for asynchronous actions.
